                                                                                synthetic, or recombinant onega-conotoxin. Onega-conotoxins are isolated from venoms of predatory marine snails, and have a selectivity for N-type calcium channels over PQ type channels, and so block N-type calcium channels. The omega-conotoxins of the invention channels is required, e.g. in the reduction of neuronal damage following ischemia, production of analgesia, or enhancement of opiate analgesia, in the treatment of schizophrenia, stimulant induced psychoses, in the infinitement of schizophrenia, stimulant induced psychoses, and also in the inhibition of progression of neuropathic pain. They can also be used in a screen to identify compounds with activity at N-type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents an omega-conotoxin. Omega-conotoxins are isolated from venoms of predatory marine snails, and have a selectivity for N-type calcium channels over P/O type channels, and so block N-type calcium channels. The omega-conotoxins of the invention can be used in any disease or disorder where blockage of N-type calcium channels is required, e.g. in the reduction of neuronal damage following ischemia, production of analgesia, or enhancement of opiate analgesia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Omega-conotoxin, venom; predatory marine snail; N-type calcium channel; neuronal damage reduction; ischemia; analgesia; optate analgesia; schizophrenia; stimulant induced psychosis; hypertension; inflammation; bronchotension; neuropathic pain; voltage sensitive calcium channel.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel peptides used for the treatment of disorders and diseases where blockage of the N-type calcium channels is required \,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Omega-conotoxins are isolated from venoms of predatory marine snails, and have a selectivity for N-type calcium channels over P/Q type channels, and so block N-type calcium channels. The omega-conotoxins of the invention can be used in any disease or disorder where blockage of N-type calcium channels is required, e.g. in the reduction of neuronal damage following ischemia, production of analgesia, or enhancement of opiate analgesia, in the treatment of schizophrenia, stimulant induced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          psychoses, hypertension, inflammation, and diseases which cause bronchotension, and also in the inhibition of progression of neuropathic pain. They can also be used in a screen to identify compounds with activity at N-type voltage sensitive calcium channels.
in the treatment of schizophrenia, stimulant induced psychoses, hypertension, inflammation, and diseases which cause bronchotension, and also in the inhibition of progression of neuropathic pain. They can also be used in a screen to identify compounds with activity at N-type voltage sensitive calcium channels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Omega-conotoxin; venom; predatory marine snail; N-type calcium channel; neuronal damage reduction; ischemia; analgesia; oplate analgesia; CVID; schizophrenia; stimulant induced psychosis; hypertension; inflammation; bronchotension; neuropathic pain; voltage sensitive calcium channel.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel peptides used for the treatment of disorders and diseases where blockage of the N-type calcium channels is required \cdot

                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAY43718-36 represent derivatives of omega-conotoxin CVID. Omega-conotoxins are isolated from venoms of predatory marine snalls, and have a selectivity for N-type calcium channels over P/Q type channels. and so block N-type calcium channels are over P/Q type channels. The omega-conotoxins of the invention can be used in any disease or disorder where blockage of N-type calcium channels is required, e.g. in the reduction of neuronal damage following ischemia, production of analgesia, or enhancement of oplate analgesia, in the treatment of schizophrenia, stimulant induced psychoses, hypertension, inflammation, and diseases which cause bronchotension, and also in the inhibition of progression of neuropathic pain. They can also be used in a screen to identify compounds with activity at N-type voltage sensitive calcium channels.
                                                                                                                                                             Omega-conotoxin; venom; predatory marine snail; N-type calcium channel; neuronal damage reduction; ischiemia; analgesia; oplate analgesia; CVID; schizophrenia; stimulant induced psychosis; hypertension; inflammation; bronchotension; neuropathic pain; voltage sensitive calcium channel.

Omega-conocoxing are isolated from venoms of predatory marine snails, and have a selectivity for N-type calcium channels over P/O type channels, and so block N-type calcium channels. The omega-conotoxins of the invention can be used in any disease or disorder where blockage of N-type calcium channels is required, e.g. in the reduction of neuronal damage following ischemia, production of analgesia, or enhancement of opiate analgesia, in the treatment of schizophrenia, stimulant induced psychoses, hypertension, inflammation, and diseases which cause pronchotension, and also in the inhibition of progression of neuropathic pain. They can also be used in a screen to identify compounds with activity at N-type voltage sensitive calcium channels.
                                                                                                                                Omega-conotoxin; venom; predatory marine snail; N-type calcium channel; neuronal damage reduction; ischemia; analgesia; opiate analgesia; CVID; schizophrenia; stimulant induced psychosis; hypertension; inflammation; bronchotension; neuropathic pain; voltage sensitive calcium channel.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Omega-conotoxin; venom; predatory marine snail; N-type calcium channel; neuronal damage reduction; ischemia; analgesia; opiate analgesia; CVID; schizophrenia; stimulant induced psychosis; hypertension; inflammation; bronchotension; neuropathic pain; voltage sensitive calcium channel.

AAY43718-36 represent derivatives of omega-conotoxin CVID.

Omega-conotoxins are isolated from venoms of predatory marine snalls, and have a selectivity for N-type calcium channels over P/O type channels, and so block N-type calcium channels over P/O type channels.

The omega-conotoxins of the invention can be used in any disease or disorder where blockage of N-type calcium channels is required, e.g. in the reduction of neuronal damage following ischemia, production of analgesia, or enhancement of oplate analgesia, in the treatment of schizophrenia, stimulant induced psychoses, hypertension, inflammation, and diseases which cause bronchotension, and also in the inhibition of progression of neuropathic pain. They can also be used in a screen to identify compounds with activity at N-type voltage sensitive calcium channels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Omega-conotoxin, venom; predatory marine snail; N-type calcium channel; neuronal damage reduction; ischemia; analgesia; opiate analgesia; CVID; schizophrenia; stimulant induced psychosis; hypertension; inflammation; bronchotension; neuropathic pain; voltage sensitive calcium channel.
                                                                                                                          Novel peptides used for the treatment of disorders and diseases where blockage of the N-type calcium channels is required \,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AMY43718-36 represent derivatives of omega-conotoxin CVID.

Omega-conotoxins are isolated from venoms of predatory marine snails, and have a selectivity for N-type calcium channels over P/Q type channels, and and so block N-type calcium channels. The omega-conotoxins of the invention can be used in any disease or disorder where blockage of N-type calcium channels is required, e.g. in the reduction of neuronal damage following ischemia, production of analgesia, or enhancement of opiate analgesia, in the treatment of schizophrenia, stimulant induced psychoses, hypertension, inflammation, and diseases which cause bronchotension, and also in the inhibition of progression of neuropathic pain. They can also be used in a screen to identify compounds with activity at N-type voltage sensitive calcium channels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Omega-conotoxin; venom; predatory marine snail; N-type calcium channel; neuronal damage reduction; ischemia; analgesia; opiate analgesia; CVID; schizophrenia; stimulant induced psychosis; hypertension; inflammation;
                                                                                                                                                                                                                                                                                                                                                       Novel peptides used for the treatment of disorders and diseases where blockage of the N-type calcium channels is required \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           bronchotension; neuropathic pain; voltage sensitive calcium channel.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         222222222X8
                                                                                                                                                                Omega-conotoxins are isolated from venoms of predatory marine snails, and have a selectivity for N-type calcium channels over P/O type channels, and and so block N-type calcium channels. The omega-conotoxins of the invention can be used in any disease or disorder where blockage of N-type calcium channels is required, e.g. in the reduction of neuronal damage following ischemia, production of analgesia, or enhancement of opiate analgesia, in the treatment of schizophrenia, stimulant induced psychoses, hypertension, inflammation, and diseases which cause bronnochetension, and also in the inhibition of progression of neuropathic pain. They can also be used in a screen to identify compounds with activity at N-type voltage sensitive calcium channels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAY43718-36 represent derivatives of omega-conotoxin CVID. Omega-conotoxins are isolated from venoms of predatory marine snails, and have a selectivity for N-type calcium channels over P/Q type channels,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Omega-conotoxin; venom; predatory marine snail; N-type calcium channel; neuronal damage reduction; ischhania; analgesia; opiate analgesia; CVID; schizophrenia; stimulant induced psychosis; hypertension; inflammation, bronchotension; neuropathic pain; voltage sensitive calcium channel.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel peptides used for the treatment of disorders and diseases where blockage of the N\text{-}\mathrm{type} calcium channels is required

invention can be used in any disease or disorder where blockage of N-type calcium channels is required, e.g. in the reduction of neuronal damage following ischemia, production of analgesia, or enhancement of opiate analgesia, in the treatment of schizophrenia, stimulant induced psychoses, hypertension, inflammation, and diseases which cause pronchotension, and also in the inhibition of progression of neuropathic pain. They can also be used in a screen to identify compounds with activity at N-type voltage sensitive calcium channels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AMY43718-36 represent derivatives of omega-conotoxin CVID.

Omega-conotoxins are isolated from venoms of predatory marine snails, and have a selectivity for N-type calcium channels over P/O type channels, and so block N-type calcium channels. The omega-conotoxins of the invention can be used in any disease or disorder where blockage of N-type calcium channels is required, e.g. in the reduction of neuronal damage following ischemia, production of analgesia, or enhancement of opiate analgesia, in the treatment of schizophrenia, stimulant induced pronchotension, and also in the inhibition of progression of neuropathic pain. They can also be used in a screen to identify compounds with activity at N-type voltage sensitive calcium channels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Omega-conotoxin; venom; predatory marine snail; N-type calcium channel; neuronal damage reduction; ischemia; analgesia; Oplate analgesia; CVID; schizophrenia; stimulant induced psychosis; hypertension; inflammation; bronchotension; neuropathic pain; voltage sensitive calcium channel.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         and diseases where

Omega-conolocation are isolated from venoms of predatory marine snails, and have a selectivity for Netype calcium channels over P/O type channels, and so block N-type calcium channels. The omega-conolocation of the invention can be used in any disease or disorder where blockage of N-type calcium channels is required, e.g. in the reduction of neuronal damage following ischemia, production of analgesia, or enhancement of oplate analgesia, in the treatment of schizophrenia, stimulant induced psychoses, hypertension, inflammation, and diseases which cause pronchotension, and also in the inhibition of progression of neuropathic pain. They can also be used in a screen to identify compounds with activity at N-type voltage sensitive calcium channels.
                                                                                                                                                                             Omega-conotoxin; venom; predatory marine snail; N-type calcium channel; neuronal damage reduction; ischemia; analgesia; opiate analgesia; VVID; schizophrenia; stimulant induced psychosis; hypertension; inflammation; bronchotension; neuropathic pain; voltage sensitive calcium channel.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel peptides used for the treatment of disorders and diseases where blockage of the N-type calcium channels is required \,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Omega-conotoxins are isolated from venoms of predatory marine snails, and have a selectivity for N-type calcium channels over P/O type channels, and and so block N-type calcium channels. The omega-conotoxins of the invention can be used in any disease or disorder where blockage of the calcium channels is required, e.g. in the reduction of neuronal damage following ischemia, production of analgesia, or enhancement of opiate analgesia, in the treatment of schizophrenia, stimulant induced psychoses, hypertension, inflammation, and diseases which cause bronnototension, and also in the inhibition of progression of neuropathic pain. They can also be used in a screen to identify compounds with activity at N-type voltage sensitive calcium channels.

The invention provides the primary nucleotide sequence of the WSBV genome (AAM6289), predicted transcript sequences (AAM6289) and encoded proteins (AAM64910-AAM625051) and oligonucleotide sequences (AAM62840-63160) suitable for use as primers or probes. The nucleic acid molecules and proteins of the invention are useful for diagnosis and monitoring viral infection, in screens for antiviral agents and for monitoring viral gene expression or activity during a treatment regimen. The nucleic acid molecules are also useful as antisense constructs to control viral gene expression in infected cells and tissues and to create transgenic viral resistant shrimp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Omega-conotoxin; venom; predatory marine snail; N-type calcium channel; neuronal damage reduction; ischemia; analgesia; opiate analgesia; schizophrenia; stimulant induced psychosis; hypertension; inflammation; bronchotension; neuropathic pain; voltage sensitive calcium channel.
                                                                                                                                                                                                                                                                                                                                                                                                                Primary nucleotide sequence of the shrimp white spot Bacilliform virus (WSBV), useful for producing viral polypeptides that can be used to screen for agents that are useful for treating WSBV infection -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              are isolated from venoms of predatory marine snails, and have a selectivity for N-type calcium channels over P/O type channels, and so block N-type calcium channels. The omega-conotoxins of the invention can be used in any disease or discorder where blockage of N-type calcium channels is required, e.g. in the reduction of neuronal damage following ischemia, production of analgesia, or enhancement of opiate analgesia, in the treatment of schizophrenia, stimulant induced psychoses, hypertension, inflammation, and diseases which cause bronchotension, and also in the inhibition of progression of neuropathic pain. They can also be used in a screen to identify compounds with activity at N-type
                                        Omega-conotoxin; venom; predatory marine snail; N-type calcium channel; neuronal damage reduction; ischimaia; analgesia; oplate analgesia; schizophrenia; stimulant induced psychosis; hypertension; inflammation; bronchotension; neuropathic pain; voltage sensitive calcium channel.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Shrimp white spot Bacilliform virus; WSBV; diagnosis; viral infection; antiviral agent; gene expression; antisense construct; transgenic viral resistant shrimp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel peptides used for the treatment of disorders and diseases where blockage of the N-type calcium channels is required \,

The present sequence represents the second loop of an isolated, synthetic, or recombinant omega-conotoxin. Omega-conotoxins are isolated from venoms of predatory marine snails, and have a selectivity for N-type calcium channels. The omega-conotoxins of the invention can be used in any disease of disorder where blockage of N-type calcium channels. The omega-conotoxins of the invention can be used in any disease of disorder where blockage of N-type calcium channels is required, e.g. in the reduction of neuronal damage following ischemia, production of analgesia, or enhancement of opiate analgesia, in the treatment of schizophrenia, stimulant induced psychoses, hypertension, inflammation, and diseases which cause bronchotension, and also in the inhibition of progression of neuropathic pain. They can also be used in a screen to identify compounds with activity at N-type voltage sensitive calcium channels.
                                                                                                                                                                                           Novel peptides used for the treatment of disorders and diseases where blockage of the N-type calcium channels is required \,
                                                                                             Alewood PF, Nielsen KJ;

        TISSUE SPECIFICITY: Expressed by the venom duct.

PHARMACEUTICAL: Is under clinical trial by Neurex. It blocks acute pain in patients who no longer obtain relief from opiate drugs. It is 100 to 1000 times more potent than morphine. By blocking calcium channels it disable nerves that transmit pain signals. SIMILARITY: BELONGS TO THE O-SUPERFAMILY OF CONOTOXINS. OMEGA-TYPE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    J. Biol. Chem. 275:35335-35344(2000).
-!- FUNCTION: Omega-conotoxins act at presynaptic membranes, they bind and block voltage-sensitive calcium channels (VSCC) (By similarity). This toxin blocks N-, P-, and Q-type calcium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -1- TISSUE SPECIFICITY: Expressed by the venom duct.

J. Biol. Chem. 275:35335-3334(2000).
-!- FUNCTION: Omega-conotoxins act at presynaptic membranes, they bind and block voltage-sensitive calcium channels (VSCC) (By similarity). This toxin blocks N-, P-, and Q-type calcium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            -i- TISSUE SPECIFICITY: Expressed by the venom duct.
-i- SIMILARITY: BELONGS TO THE O-SUPERFAMILY OF CONOTOXINS. OMEGA-TYPE

Biol. 263:297-310(1996).

-: FUNCTION: Omega-conotoxins act at presynaptic membranes, they bind and block voltage-sensitive calcium channels (VSCC). This toxin blocks N-, P-, and Q-type calcium channels.

-: SUBCELLULAR LOCATION: Secreted.
-: TISSUE SPECIFICITY: Expressed by the venom duct.
-: SIMILARITY: BELONGS TO THE O-SUPERFAMILY OF CONOTOXINS. OMEGA-TYPE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                         Ramilo C., Zafaralla G.C., Nadasdi L., Hammerland L.G., Yoshikami D., Gray W.R., Kristipati R., Ramachandran J., Miljanich G., Olivera B.M., Cruz L.J.;

Res. Commun. 254:32-35(1999).
-!- FUNCTION: Omega-conotoxins act at presynaptic membranes, they bind and block voltage-sensitive calcium channels (VSCC). This toxin blocks channels of the N-type as well as other types.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                -1- SUBCELLULAR LOCATION: Secreted.
-1- TISSUE SPECIFICITY: Expressed by the venom duct.
-1- SIMILARITY: BELONGS TO THE O-SUPERFAMILY OF CONOTOXINS. OMEGA-TYPE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MEDLINE-94150815; Pubmed-8107968; Monde V.D., Haack J.A., Naisbitt S.R., Miljanich G., Ramachandran J., Nasdasdi L., Olivera B.M., Hillyard D.R., Gray W.R.; Masdasdi L., Mary Petide liquad for Ca channel subtypes."; Neuropharmacology 32:1141-1149(1993).

                                                                                                                                                                                                                                                                                       Lewis R.J., Nielsen K.J., Craik D.J., Loughnan M.L., Adams D.A., Sharpe I.A., Luchlan T., Adams D.J., Bond T., Thomas L., Jones A., Matheon J.L., Drinkwater R., Andrews P.R., Alewood P.F.; Movel omega-conotoxins from Conus catus discriminate among neuronal calcium channel subtypes."

J. Biol. Chem. 275:35335-35344(2000).

-!- FONCTION: Omega-conotoxins act at presynaptic membranes, they bin and block voltage-sensitive calcium channels (VSCC) (By similarity). This toxin blocks N'type calcium channels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Olivera B.M., Cruz L.J., de Santos V., Lecheminant G.W., Griffin D., Zelkus R.D., McIntosh J.M., Galyean R., Varga J., Gray W.R.,

Pept. Res. 53:343-351(1999).
-!- FUNCTION: Omega-conotoxins act at presynaptic membranes, they bind and block voltage-sensitive calcium channels (VSCC).
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Expressed by the venom duct.
-!- SIMILARITY: BELONGS TO THE O-SUPERFAMILY OF CONOTOXINS. OMEGA-TYPE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               OMEGA-CONOTOXIN GVIB.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 1108, Application US/09764864

Patent No. US20020132753A1

GENERAL INFORMATION:

TITLE OF INVENTION: Nucleic Acids, Proteins, and Antibodies

FIEE REFERENCE: PTZ3

CURRENT APPLICATION NUMBER: US/09/764,864

CURRENT FILING DATE: 2001-01-17

Prior application data removed - consult PALM or file wrapper

NUMBER OF SEQ ID NOS: 1792

SOFTWARE: Patentin Ver. 2.0

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                            (without alignments)

Omega-conotoxin; venom; predatory marine snail; N-type calcium channel; neuronal damage reduction; ischemia; analgesia; oplate analgesia; schizophrenia; stimulant induced psychosis; hypertension; inflammation; bronchotension; neuropathic pain; voltage sensitive calcium channel.
in the treatment of schizophrenia, stimulant induced psychoses, hypertension, inflammation, and diseases which cause bronchotension, and also in the inhibition of progression of neuropathic pain. They car also be used in a screen to identify compounds with activity at N-type voltage sensitive calcium channels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Amino acid sequence of an omega-conotoxin R10-CVID.

                                                                                                                                                                                                                                                                                          op
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      XX
                                                                                                                                                                                                                                                                                                                                                                                                                                                               0
                                                                       The present sequence represents the fourth loop of an isolated, synthetic, or recombinant omega-conotoxin. Omega-conotoxins are isolated from wenoms of predatory marine snalls, and have a selectivity for N-type calcium channels over P/O type channels, and so block N-type calcium channels. The omega-conotoxins of the invention can be used in any disease or disorder where blockage of N-type calcium channels is required, e.g. in the reduction of analgesia, or enhancement of opiate analgesia, in the treatment of schizophrenia, stimulant induced psychoses, hypertension, inflammation, and diseases which cause bronchotension, and also in the inhibition of progression of neuropathic pain. They can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     are isolated from venoms of predatory marine snails, and have a selectivity for N-type calcium channels over P/Q type channels, and so block N-type calcium channels. The omega-conocoxins of the invention can be used in any disease or disorder where blockage of N-type calcium channels is required, e.g. in the reduction of neuronal damage following ischemia, production of analgesia, or enhancement of opiate analgesia,
                                                                                                                                                                                                                                                                                   and also in the inhibition of progression of neuropathic pain. They can also be used in a screen to identify compounds with activity at N-type voltage sensitive calcium channels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Omega-conotoxin; venom; predatory marine snail; N-type calcium channel; neuronal damage reduction; ischiemia; analysesia; oplate analgesia; schizophrenia; stimulant induced psychosis; hypertension; inflammation; bronchotension; neuropathic pain; voltage sensitive calcium channel.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel peptides used for the treatment of disorders and diseases where blockage of the N\text{-}\mathrm{type} calcium channels is required -

The present sequence represents a modified version of omega-conotoxin CVID (see AAV43712). Omega-conotoxins are isolated from venoms of predatory marine snails, and have a selectivity for N-type calcium channels over P/O type channels, and so block N-type calcium channels. The omega-conotoxins of the invention can be used in any disease or disorder where blockage of N-type calcium channels is required, e.g. in the reduction of neuronal damage following ischemia, production of analgesia, or enhancement of opiate analgesia, in the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        schizophrenia, stimulant induced psychoses, hypertension, inflammation, and diseases which cause bronchotension, and also in the inhibition of progression of neuropathic pain. They can also be used in a screen to identify compounds with activity at N-type voltage sensitive calclum
    and diseases where
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     21; Length 27;
Novel peptides used for the treatment of disorders a blockage of the N-type calcium channels is required

                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a modified version of omega-conotoxin predatory marine snails, and have a selectivity for N-type calcium channels over P/O type channels, and so block N-type calcium channels. The omega-conotoxins of the invention can be used in any disease or the omega-conotoxins of the invention can be used in any disease or the reduction of neuronal damage following ischemia, production of analgesia, or enhancement of opsiate analgesia, in the treatment of schizophrenia, stimulant induced psychoses, hypertension, inflammation, and diseases which cause bronchotension, and also in the inhibition of progression of neuropathic pain. They can also be used in a screen to identify compounds with activity at N-type voltage sensitive calcium
                                                                                                                                                                      Omega-conotoxin; venom; predatory marine snail; N-type calcium channel; neuronal damage reduction; ischhemia; analysesia; opiate analgesia; schizophrenia; stimulant induced psychosis; hypertension; inflammation; bronchotension; neuropathic pain; voltage senaitive calcium channel.

AMY43718-36 represent derivatives of omega-conotoxin CVID.

Omega-conotoxins are isolated from venoms of predatory marine snails, and have a selectivity for N-type calcium channels over P/O type channels, and so block N-type calcium channels. The omega-conotoxins-of-the invention can be used in any disease or disorder where blockage of N-type calcium channels. In the omega-conotoxins-of-the calcium channels is required, e.g. in the reduction of neuronal damage following ischemia, production of analgesia, or enhancement of opiate analgesia, in the treatment of schizophrenia, stimulant induced psychoses, hypertension, inflammation, and diseases which cause bronchotension, and also in the inhibition of progression of neuropathic pain. They can also be used in a screen to identify compounds with activity at N-type voltage sensitive calcium channels.
                                                                                                                                             Omega-conotoxin, venom, predatory marine snail, N-type calcium channel, neuronal damage reduction; ischemia; analgesia; opiate analgesia; CVID; schizophrenia; stimulant induced psychosis; hypertension; inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Omega-conotoxin; venom; predatory marine snail; N-type calcium channel; neuronal damage reduction; ischemia; analgesia; opiate analgesia; CVID; schizophrenia; stimulant induced psychosis; hypertension; inflammation; bronchotension; neuropathic pain; voltage sensitive calcium channel.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      and diseases where

invention can be used in any disease or disorder where blockage of N-type calcium channels is required, e.g. in the reduction of neuronal damage following ischemia, production of analgesia, or enhancement of opiate analgesia, in the treatment of schizophrenia, stimulant induced psychoses, hypertension, inflammation, and diseases which cause pronchotension, and also in the inhibition of progression of neuropathic pain. They can also be used in a screen to identify compounds with activity at N-type voltage sensitive calcium channels.
                                                                                                                                                                                                                                                                 AAY43718-36 represent derivatives of omega-conotoxin CVID. Omega-conotoxins are isolated from venoms of predatory marine snails, and have a selectivity for N-type calcium channels over P/Q type channels, and so block N-type calcium channels. The omega-conotoxins of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Omega-conotoxin; venom; predatory marine snail; N-type calcium channel; neuronal damage reduction; ischemia; analgesia; opiate analgesia; CVID; schtzophrenia; stimulant induced psychosis; hypertension; inflammation; bronchotension; neuropathic pain; voltage sensitive calcium channel.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAY43718-36 represent derivatives of omega-conotoxin CVID. Omega-conotoxins are isolated from venoms of predatory marine snails, and have a selectivity for N-type calcium channels over P/O type channels and so block N-type calcium channels. The omega-conotoxins of the invention can be used in any disease or disorder where blockage of N-type calcium channels is required, e.g. in the reduction of neuronal damage following ischemia, production of analgesia, or enhancement of oplate analgesia, in the treatment of schizophrenia, stimulant induced psychoses, hypertension, inflammation, and diseases which cause bronchotension, and also in the inhibition of progression of neuropathic activity at N-type voltage sensitive calcium channels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Omega-conotoxin; venom; predatory marine snail; N-type calcium channel; neuronal damage reduction; ischemia; analysesia; opiate analysesia; OVID; schizophrenia; stimulant induced psychosis; hypertension; inflammation; bronchotension; neuropathic pain; voltage sensitive calcium channel.
                                                                                                                                                                                                                                                                                                                                                                                          Novel peptides used for the treatment of disorders and diseases where blockage of the N-type calcium channels is required \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

                                                   AAY43718-36 represent derivatives of omega-conotoxin CVID.

Omega-conotoxins are isolated from venoms of predatory marine snails, and have a selectivity for N-type calcium channels over P/O type channels, and so block N-type calcium channels. The omega-conotoxins of the invention can be used in any disease or disorder where blockage of N-type calcium channels is required, e.g. in the reduction of neuronal damage following ischemia, production of analgesia, or enhancement of opiate analgesia, in the treatment of schizophrenia, stimulant induced psychoses, hypertension, inflammation, and diseases which cause bronchotension, and also in the inhibition of progression of neuropathic activity at N-type voltage sensitive calcium channels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

The omega-conotoxins of the invention can be used in any disease or disorder where blockage of N-type calcium channels is required, e.g. in the reduction of neuronal damage following ischemial, production of analgesia, or enhancement of oplate analgesia, in the treatment of schizophrenia, stimulant induced psychoses, hypertension, inflammation, and diseases which cause
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Omega-conotoxin; venom; predatory marine snail; N-type calcium channel; neuronal damage reduction; ischhamia; analgesia; Oplate analgesia; OVID; schizophrenia; stimulant induced psychosis; hypertension; inflammation; bronchotension; neuropathic pain; voltage sensitive calcium channel.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel peptides used for the treatment of disorders and diseases where blockage of the N\text{-}\mathrm{type} calcium channels is required .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Amino acid sequence of an omega-conotoxin derivative of CVID.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   100.0%; Score 30; DB 21; Length 27; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAY43718-36 represent derivatives of omega-conotoxin CVID.

Omega-conotoxins are isolated from venoms of predatory marine snails, and have a selectivity for N-type calcium channels over P/Q type channels, and so block N-type calcium channels. The omega-conotoxins of the invention can be used in any disease or disorder where blockage of N-type calcium channels. In the reduction of neuronal damage calcium channels is required, e.g. in the reduction of neuronal damage following ischemia, production of analgesia, or enhancement of opiate analgesia, in the treatment of schizophrenia, stimulant induced psychoses, hypertension, inflammation, and diseases which cause bronchotension, and also in the inhibition of progression of neuropathic pain. They can also be used in a screen to identify compounds with activity at N-type voltage sensitive calcium channels.
